

## Measures of analytic type and semicharacters

Hiroshi YAMAGUCHI

**Abstract.** Helson and Lowdenslager extended the classical F. and M. Riesz theorem as follows: Let  $G$  be a compact abelian group with ordered dual. Let  $\mu$  be a bounded regular measure on  $G$  which is of analytic type. Then

(I)  $\mu_a$  and  $\mu_s$  are of analytic type, and

(II)  $\hat{\mu}_s(0) = 0$ ,

where  $\mu_a$  and  $\mu_s$  are the absolutely continuous part of  $\mu$  and the singular part of  $\mu$ , respectively. Forelli gave a generalization of the result of Helson and Lowdenslager for a compact abelian group with ordered dual. As for (I), Doss, Yamaguchi and Hewitt-Koshi-Takahashi gave its extensions for locally compact abelian groups. In this paper, we extend a result of Forelli, which is related to (II), to locally compact abelian groups.

### 1. Introduction

Let  $G$  be a LCA group (locally compact abelian group) with the dual group  $\hat{G}$ . We denote by  $m_G$  the Haar measure of  $G$ . Let  $L^1(G)$  and  $M(G)$  be the group algebra and the measure algebra, respectively. Let  $M_a(G)$  be the set of all measures in  $M(G)$  which are absolutely continuous with respect to  $m_G$ . Then we can identify  $M_a(G)$  with  $L^1(G)$ . Let  $M_s(G)$  be the closed subspace of  $M(G)$  consisting of singular measures. We denote by  $M^+(G)$  the subset of  $M(G)$  consisting of positive measures. For  $\mu \in M(G)$ , let  $\mu_a$  and  $\mu_s$  be the absolutely continuous part of  $\mu$  and the singular part of  $\mu$ , respectively.  $\hat{\mu}$  denotes the Fourier-Stieltjes transform of  $\mu$ , i.e.,  $\hat{\mu}(\gamma) = \int_G (-x, \gamma) d\mu(x)$  for  $\gamma \in \hat{G}$ . For a subset  $E$  of  $\hat{G}$ , let  $M_E(G)$  be the space of measures in  $M(G)$  whose Fourier-Stieltjes transforms vanish off  $E$ .

Helson and Lowdenslager extended the classical F. and M. Riesz theorem as follows.

**Theorem A** ([17, 8.2.3 Theorem]). Let  $G$  be a compact abelian group with ordered dual. Let  $\mu$  be a measure in  $M(G)$  such that  $\hat{\mu}(\gamma) = 0$  for  $\gamma < 0$ . Then

$$(I) \quad \hat{\mu}_a(\gamma) = \hat{\mu}_s(\gamma) = 0 \quad \text{for } \gamma < 0,$$

$$(II) \quad \hat{\mu}_s(0) = 0.$$

For a compact abelian group  $G$  with ordered dual, let  $A = \{f \in C(G) : \hat{f}(\gamma) = 0 \text{ for } \gamma < 0\}$ . Then  $A$  becomes a Dirichlet algebra. As for Theorem A (II), Forelli obtained the following.

**Theorem B** ([7, Theorem 2]). Let  $G$  be a compact abelian group with ordered dual. Let  $\sigma \in M^+(G)$  be a representing measure for  $A$ . Let  $\mu$  be a measure in  $M_s(G)$  such that  $\hat{\mu}(\gamma) = 0$  for  $\gamma < 0$ . Then  $\mu * \sigma$  belongs to  $M_s(G)$ .

Our purpose is to extend Theorem B to LCA groups. In section 2, we state definitions and our result. We give the proof in section 3.

## 2. Notation and results

Let  $G$  be a LCA group and  $P$  a proper closed semigroup in  $\hat{G}$  such that  $P \cup (-P) = \hat{G}$ . We note that  $\overset{\circ}{P}$  (the interior of  $P$ ) is dense in  $P$ . Set  $\Lambda = P \cap (-P)$ . Let  $\bar{D}$  be the closed unit disc in the complex plane  $\mathbb{C}$ , i.e.,  $\bar{D} = \{z \in \mathbb{C} : |z| \leq 1\}$ . A function  $\zeta : P \rightarrow \bar{D}$  is called a semicharacter (on  $P$ ) if  $\zeta(\gamma_1 + \gamma_2) = \zeta(\gamma_1)\zeta(\gamma_2)$  for  $\gamma_1, \gamma_2 \in P$ . We denote by  $\Delta$  the set of all nonzero continuous semicharacters. Define a subset  $\Delta^+$  of  $\Delta$  as follows:

$$(2.1) \quad \Delta^+ = \{\zeta \in \Delta : 0 \leq \zeta(\gamma) \leq 1 \text{ for all } \gamma \in P\}.$$

For each  $\zeta \in \Delta$ ,  $|\zeta|$  belongs to  $\Delta^+$ . And, for  $\rho \in \Delta^+$ , we have  $\rho(\gamma) = 1$  on  $\Lambda$  since  $\Lambda$  is a subgroup of  $\hat{G}$ . By [1, 3.1 Theorem], each  $\zeta \in \Delta$  has a polar decomposition. That is, there exists  $x \in G$  such that

$$(2.2) \quad \zeta = |\zeta|x.$$

For each  $\zeta \in \Delta$ , it follows from [1, 4.7 Theorem and 4.8 Corollary] that there exists a unique probability measure  $m_\zeta \in M^+(G)$  such that

$$(2.3) \quad \hat{m}_\zeta(\gamma) = \zeta(\gamma) \text{ for } \gamma \in P.$$

For  $\zeta, \zeta' \in \Delta$ , we have  $m_{\zeta\zeta'} = m_\zeta * m_{\zeta'}$ . Especially, (2.2) implies

$$(2.4) \quad m_\zeta = m_{|\zeta|} * \delta_{-x},$$

where  $\delta_{-x}$  is the point mass at  $-x$ .

Now we state our theorem.

**THEOREM 2.1.** For  $\rho \in \Delta^+$  and  $\mu \in M_P(G) \cap M_s(G)$ , we have  $\mu * m_\rho \in M_s(G)$ .

By (2.4) and Theorem 2.1, we get the following corollary.

**COROLLARY 2.2.** For  $\zeta \in \Delta$  and  $\mu \in M_P(G) \cap M_s(G)$ , we have  $\mu * m_\zeta \in M_s(G)$ .

*Remark 2.3.* (i) Let  $G$  be a compact abelian group with ordered dual. Let  $P = \{\gamma \in \hat{G} : \gamma \geq 0\}$  and  $A = \{f \in C(G) : \hat{f}(\gamma) = 0 \text{ for } \gamma < 0\}$ . Let  $\sigma \in M^+(G)$  be a representing measure for  $A$ . Then  $\hat{\sigma}$  becomes a nonzero semicharacter on  $P$ , and  $m_{\hat{\sigma}} = \sigma$ . Hence Theorem B follows from Corollary 2.2.

(ii) Let  $G$  be a compact abelian group, and suppose that there exists a nontrivial homomorphism  $\psi$  from  $\hat{G}$  into  $\mathbb{R}$ . Put  $P = \{\gamma \in \hat{G} : \psi(\gamma) \geq 0\}$ . Let  $\phi : \mathbb{R} \rightarrow G$  be the dual homomorphism of  $\psi$ , i.e.,  $(\phi(t), \gamma) = \exp(i\psi(\gamma)t)$  for  $\gamma \in \hat{G}$ ,  $t \in \mathbb{R}$ . Let  $\mu \in M_P(G) \cap M_s(G)$  and  $\lambda \in M(\mathbb{R})$ . Then, by [4, Theorem 3.1 and Lemma 5.1], we have  $\mu * \phi(\lambda) \in M_s(G)$ , where  $\phi(\lambda)$  is the continuous image of  $\lambda$  under  $\phi$ .

### 3. Proof of Theorem

In this section we prove Theorem 2.1. First we state several lemmas. Let  $\pi : \hat{G} \rightarrow \hat{G}/\Lambda$  be the natural homomorphism, and put  $\tilde{P} = \pi(P)$ . Then  $\tilde{P}$  is a closed semigroup in  $\hat{G}/\Lambda$  such that  $\tilde{P} \cup (-\tilde{P}) = \hat{G}/\Lambda$  and  $\tilde{P} \cap (-\tilde{P}) = \{0\}$ . Thus  $\tilde{P}$  induces a totally linear order on  $\hat{G}/\Lambda$ . For  $\rho \in \Delta^+$ , let  $L_\rho^+ = \{\gamma \in P : \rho(\gamma) > 0\}$  and  $\Gamma_\rho = L_\rho^+ - L_\rho^+$ .

**LEMMA 3.1.** For  $\rho \in \Delta^+$ , the following hold.

- (i)  $\Gamma_\rho$  is an open subgroup of  $\hat{G}$ ;
- (ii)  $\Lambda \subset L_\rho^+ \subset \Gamma_\rho$ ;
- (iii)  $P \cap \Gamma_\rho = L_\rho^+$ ;
- (iv) Let  $\gamma \in P$  and  $\xi \in \Gamma_\rho$ . If  $\pi(\gamma) \leq \pi(\xi)$ , then  $\gamma \in L_\rho^+$ ;
- (v)  $\Gamma_\rho = L_\rho^+ \cup (-L_\rho^+)$ .

**PROOF.** (i): Set  $V_\rho = \{\gamma \in \overset{\circ}{P} : \rho(\gamma) > 0\}$ . Since  $\overset{\circ}{P}$  is dense in  $P$ ,  $V_\rho$  is nonempty, and  $V_\rho$  is an open semigroup in  $\hat{G}$ . Hence  $\Gamma_\rho$  is an open subgroup of  $\hat{G}$  since  $V_\rho - V_\rho$

is included in  $\Gamma_\rho$ .

(ii): This is trivial since  $\rho(\gamma) = 1$  on  $\Lambda$ .

(iii): For  $\gamma \in P \cap \Gamma_\rho$ , there exist  $\xi_1, \xi_2 \in L_\rho^+$  such that  $\gamma = \xi_1 - \xi_2$ . Then  $\xi_1 = \gamma + \xi_2$ , and so  $0 \neq \rho(\xi_1) = \rho(\gamma)\rho(\xi_2)$ . Hence  $\rho(\gamma) \neq 0$ , which yields  $\gamma \in L_\rho^+$ . Hence  $P \cap \Gamma_\rho \subset L_\rho^+$ . The reverse inclusion relation is trivial.

(iv): Since  $0 \leq \pi(\gamma) \leq \pi(\xi)$ ,  $\xi$  belongs to  $P$ . Hence (iii) implies  $\xi \in L_\rho^+$ . On the other hand, since  $\pi(\gamma) \leq \pi(\xi)$ , there exists  $p \in P$  such that  $\xi - \gamma = p$ . Hence  $0 \neq \rho(\xi) = \rho(\gamma)\rho(p)$ , which yields  $\gamma \in L_\rho^+$ .

(v): We have  $\Gamma_\rho = (P \cap \Gamma_\rho) \cup ((-P) \cap \Gamma_\rho) = L_\rho^+ \cup (-L_\rho^+)$ , by (iii).

This completes the proof.  $\square$

LEMMA 3.2. *Let  $\rho \in \Delta^+$ , and put  $\tilde{Q} = \{\pi(\gamma) \in \hat{G}/\Lambda : \pi(\gamma) \geq \pi(\gamma') \text{ for some } \gamma' \in \Gamma_\rho\}$ . Then the following hold.*

(i)  $\tilde{Q} \supset \tilde{P}$ ;

(ii)  $\tilde{Q}$  is an open semigroup in  $\hat{G}/\Lambda$  such that  $\tilde{Q} \cup (-\tilde{Q}) = \hat{G}/\Lambda$ ;

(iii)  $\tilde{Q} \cap (-\tilde{Q}) = \tilde{\Gamma}_\rho$ , where  $\tilde{\Gamma}_\rho = \pi(\Gamma_\rho)$ .

PROOF. (i): This is trivial since  $\pi(p) \geq 0$  for all  $p \in P$ .

(ii): It is trivial that  $\tilde{Q}$  is a semigroup in  $\hat{G}/\Lambda$  such that  $\tilde{Q} \cup (-\tilde{Q}) = \hat{G}/\Lambda$ . Since  $\tilde{Q} \supset \pi(\Gamma_\rho)$  and  $\pi(\Gamma_\rho)$  is an open subgroup of  $\hat{G}/\Lambda$ ,  $\tilde{Q}$  is an open semigroup in  $\hat{G}/\Lambda$ .

(iii): Since  $\tilde{Q} \supset \tilde{\Gamma}_\rho$ , we may prove only  $\tilde{Q} \cap (-\tilde{Q}) \subset \tilde{\Gamma}_\rho$ . Let  $\pi(\gamma) \in \tilde{Q} \cap (-\tilde{Q})$ , where  $\gamma \in \hat{G}$ . We may assume  $\gamma \in P$  because  $P \cup (-P) = \hat{G}$ . Since  $\pi(\gamma) \in -\tilde{Q}$ ,  $\pi(-\gamma)$  belongs to  $\tilde{Q}$ . Hence there exists  $\xi \in \Gamma_\rho$  such that  $\pi(-\gamma) \geq \pi(\xi)$ . Then  $\pi(\gamma) \leq \pi(-\xi)$  and  $-\xi \in \Gamma_\rho$ . It follows from Lemma 3.1 (iv) that  $\gamma \in L_\rho^+$ . Hence we have  $\pi(\gamma) \in \pi(L_\rho^+) \subset \tilde{\Gamma}_\rho$ .

This completes the proof.  $\square$

When  $G$  is a compact abelian group, the following lemma is obtained in [4, Theorem 3.1 and lemma 5.2]. We give its proof for completeness.

LEMMA 3.3. *Let  $G$  be a LCA group and  $\psi$  a nontrivial continuous homomorphism from  $\hat{G}$  into  $\mathbb{R}$ . Let  $\phi : \mathbb{R} \rightarrow G$  be the dual homomorphis of  $\psi$ . Let  $\xi \in M(\mathbb{R})$ , and let  $\mu$  be a measure in  $M_s(G)$  such that  $\hat{\mu}$  vanishes on  $\psi^{-1}((-\infty, 0))$ . Then  $\phi(\xi) * \mu$  belongs to  $M_s(G)$ .*

PROOF. Since  $\hat{\mu}$  vanishes on  $\psi^{-1}((-\infty, 0))$ , we note that  $\lim_{s \rightarrow 0} \|\mu - \mu * \delta_{\phi(s)}\| = 0$  (cf. [8, Theorem 4]). Since  $\mu$  is singular, there exists a Borel set  $E$  in  $G$  such that

$m_G(E) = 0$  and  $|\mu|(E) = \|\mu\|$ . Set  $E_0 = \bigcup_{r \in \mathbb{Q}} (\phi(r) + E)$ , where  $\mathbb{Q}$  is the rational numbers. Then

$$(3.1) \quad m_G(E_0) = 0, \text{ and}$$

$$(3.2) \quad |\mu|(-\phi(r) + E_0) = \|\mu\| \quad \text{for all } r \in \mathbb{Q}.$$

Since  $s \rightarrow |\mu|(-\phi(s) + E_0)$  is a continuous function on  $\mathbb{R}$ , (3.2) implies

$$|\mu|(-\phi(s) + E_0) = \|\mu\|$$

for all  $s \in \mathbb{R}$ . Hence we get

$$\begin{aligned} \phi(|\xi|) * |\mu|(E_0) &= \int_G |\mu|(-x + E_0) d\phi(|\xi|)(x) \\ &= \int_{-\infty}^{\infty} |\mu|(-\phi(s) + E_0) d|\xi|(s) \\ &= \|\mu\| \|\xi\| \\ &= \phi(|\xi|) * |\mu|(G). \end{aligned}$$

This shows that  $\phi(\xi) * \mu$  is concentrated on  $E_0$ . Thus we get  $\phi(\xi) * \mu \in M_s(G)$ , by (3.1), and the proof is complete.  $\square$

LEMMA 3.4. *Let  $G, \psi$  and  $\phi$  be as in the previous lemma. Let  $\mu$  be a measure in  $M_s(G)$  such that  $\hat{\mu}$  vanishes on  $\psi^{-1}((-\infty, 0))$ . Let  $\sigma$  be a measure in  $M(G)$  such that  $\hat{\sigma}(\gamma) = \exp(-|\psi(\gamma)|)$  for all  $\gamma \in \hat{G}$ . Then  $\sigma * \mu \in M_s(G)$ .*

PROOF. Define  $\xi \in L^1(\mathbb{R})$  by  $d\xi(t) = \frac{1}{\pi} \cdot \frac{dt}{1+t^2}$ . Then

$$\hat{\xi}(x) = \exp(-|x|)$$

for all  $x \in \mathbb{R}$ , where  $\hat{\xi}(x) = \int_{-\infty}^{\infty} \xi(t) e^{-ixt} dt$ . Hence we have  $\sigma = \phi(\xi)$ . In fact,

$$\begin{aligned} \phi(\xi)^\wedge(\gamma) &= \int_{-\infty}^{\infty} (-\phi(t), \gamma) d\xi(t) \\ &= \int_{-\infty}^{\infty} \exp(-i\psi(\gamma)t) d\xi(t) \\ &= \hat{\xi}(\psi(\gamma)) \end{aligned}$$

$$\begin{aligned}
&= \exp(-|\psi(\gamma)|) \\
&= \hat{\sigma}(\gamma)
\end{aligned}$$

for all  $\gamma \in \hat{G}$ . Thus, by lemma 3.3, we get  $\sigma * \mu = \phi(\xi) * \mu \in M_s(G)$ .  $\square$

The following lemma is due to [22].

LEMMA 3.5. (cf. [22, Lemma 1.2]). *Let  $G$  be a LCA group, and let  $P$  be an open semigroup in  $\hat{G}$  such that  $P \cup (-P) = \hat{G}$ . Let  $H$  be the annihilator of  $P \cap (-P)$ . Let  $\mu$  be a measure in  $M_s(G) \cap M_P(G)$ . Then  $\mu * m_H$  belongs to  $M_s(G)$ .*

The following lemma follows from [5, Theorem 1].

LEMMA 3.6. (cf. [21, Lemmas (B) and (C)]). *Let  $G$  be a LCA group and  $F$  an open subgroup of  $\hat{G}$ . Let  $H$  be the annihilator of  $F$ , and let  $\alpha : G \rightarrow G/H$  be the natural homomorphism. Then the following hold.*

- (I) *Let  $\mu$  be a measure in  $M_s(G)$  such that  $\text{supp}(\hat{\mu}) \subset F$ . Then  $\alpha(\mu)$  belongs to  $M_s(G/H)$ .*
- (II) *Let  $\nu$  be a measure in  $M_s(G/H)$ . Then there exists a measure  $\mu \in M_s(G)$  such that  $\hat{\mu}(\gamma) = \hat{\nu}(\gamma)$  on  $F$  and  $\hat{\mu}(\gamma) = 0$  on  $\hat{G} \setminus F$ .*

Now we prove Theorem 2.1. Put  $\Lambda = P \cap (-P)$  and  $G_\rho = \Gamma_\rho^\perp$ . Let  $\pi : \hat{G} \rightarrow \hat{G}/\Lambda$  be the natural homomorphism. Set  $\tilde{P} = \pi(P)$  and  $\tilde{\Gamma}_\rho = \pi(\Gamma_\rho)$ . It follows from Lemma 3.2 that there exists an open semigroup  $\tilde{Q}$  in  $\hat{G}/\Lambda$  such that

$$(3.3) \quad \tilde{Q} \supset \tilde{P}, \text{ and}$$

$$(3.4) \quad \tilde{Q} \cap (-\tilde{Q}) = \tilde{\Gamma}_\rho.$$

Put  $Q = \pi^{-1}(\tilde{Q})$ . Then  $Q$  is an open semigroup in  $\hat{G}$  such that  $Q \cup (-Q) = \hat{G}$ . Moreover, since  $\Gamma_\rho \supset \Lambda$ , it follows from (3.3) and (3.4) that

$$(3.5) \quad Q \supset P, \text{ and}$$

$$(3.6) \quad Q \cap (-Q) = \Gamma_\rho.$$

Since  $\mu \in M_P(G) \cap M_s(G)$ , we have  $\mu \in M_Q(G) \cap M_s(G)$ , by (3.5); hence (3.6) and Lemma 3.5 imply

$$(3.7) \quad \mu * m_{G_\rho} \in M_s(G).$$

Let  $\pi_{G_\rho} : G \rightarrow G/G_\rho$  be the natural homomorphism. Since  $(\mu * m_{G_\rho})^\wedge(\gamma) = 0$  on  $\hat{G} \setminus \Gamma_\rho$ , it follows from (3.7) and Lemma 3.6 that

$$(3.8) \quad \pi_{G_\rho}(\mu * m_{G_\rho}) \in M_s(G/G_\rho).$$

Define  $\tilde{\rho} : \Gamma_\rho \rightarrow \mathbb{R}^+ \setminus \{0\}$  by  $\tilde{\rho}(\gamma_1 - \gamma_2) = \rho(\gamma_1)\rho(\gamma_2)^{-1}$  ( $\gamma_1, \gamma_2 \in L_\rho^+$ ), where  $\mathbb{R}^+$  is the set of nonnegative real numbers. Then  $\tilde{\rho}$  is continuous and  $\tilde{\rho}(\gamma_1 + \gamma_2) = \tilde{\rho}(\gamma_1)\tilde{\rho}(\gamma_2)$  for  $\gamma_1, \gamma_2 \in \Gamma_\rho$ . Moreover,  $\tilde{\rho}|_{P \cap \Gamma_\rho} = \rho|_{P \cap \Gamma_\rho}$ . Now we define a continuous homomorphism  $\psi : \Gamma_\rho \rightarrow \mathbb{R}$  by

$$(3.9) \quad \psi(\gamma) = -\log \tilde{\rho}(\gamma).$$

The fact that  $\tilde{\rho}|_{P \cap \Gamma_\rho} = \rho|_{P \cap \Gamma_\rho}$  implies

$$(3.10) \quad \psi^{-1}([0, \infty)) \supset P \cap \Gamma_\rho,$$

which combined with the fact that  $\hat{\mu}(\gamma) = 0$  on  $P^c$  yields

$$(3.11) \quad \pi_{G_\rho}(\mu * m_{G_\rho})^\wedge(\gamma) = 0 \text{ on } \psi^{-1}((-\infty, 0)).$$

On the other hand, since  $m_\rho$  is a positive measure and  $\hat{m}_\rho = \rho(\gamma)$  for  $\gamma \in P$ , we have

$$\hat{m}_\rho(\gamma) = \begin{cases} \rho(\gamma) & \text{for } \gamma \in P \\ \rho(-\gamma) & \text{for } \gamma \in (-P) \setminus P. \end{cases}$$

Hence we get, by (3.9),

$$(3.12) \quad \hat{m}_\rho(\gamma) = \exp(-|\psi(\gamma)|) \text{ for } \gamma \in \Gamma_\rho.$$

In fact, for  $\gamma \in P \cap \Gamma_\rho$ , we have

$$\begin{aligned} \hat{m}_\rho(\gamma) &= \rho(\gamma) = \tilde{\rho}(\gamma) = \exp(\log \tilde{\rho}(\gamma)) \\ &= \exp(-|\log \tilde{\rho}(\gamma)|) = \exp(-|\psi(\gamma)|). \end{aligned}$$

Let  $\gamma \in \{(-P) \setminus P\} \cap \Gamma_\rho$ . Then, since  $-\gamma \in P \cap \Gamma_\rho$ , we have

$$\hat{m}_\rho(\gamma) = \rho(-\gamma) = \exp(-|\psi(-\gamma)|)$$

$$= \exp(-|\psi(\gamma)|).$$

Thus (3.12) holds.

By (3.8), (3.11)-(3.12) and Lemma 3.4, we have

$$(3.13) \quad \pi_{G_\rho}(\mu * m_{G_\rho}) * \pi_{G_\rho}(m_\rho) \in M_s(G/G_\rho).$$

Define a map  $S_{G_\rho} : M(G/G_\rho) \rightarrow M(G)$  by

$$S_{G_\rho}(\nu)^\wedge(\gamma) = \begin{cases} \hat{\nu}(\gamma) & \text{for } \gamma \in \Gamma_\rho \\ 0 & \text{for } \gamma \in \hat{G} \setminus \Gamma_\rho. \end{cases}$$

It follows from (3.13) and Lemma 3.6 that

$$(3.14) \quad S_{G_\rho}(\pi_{G_\rho}(\mu * m_{G_\rho}) * \pi_{G_\rho}(m_\rho)) \in M_s(G).$$

On the other hand, since  $\text{supp}(\hat{m}_\rho) \subset \Gamma_\rho$  and  $\hat{m}_{G_\rho} = 1$  on  $\Gamma_\rho$ , we have

$$\begin{aligned} S_{G_\rho}(\pi_{G_\rho}(\mu * m_{G_\rho}) * \pi_{G_\rho}(m_\rho)) &= S_{G_\rho}(\pi_{G_\rho}(\mu * m_{G_\rho} * m_\rho)) \\ &= \mu * m_\rho. \end{aligned}$$

Hence we have  $\mu * m_\rho \in M_s(G)$ , by (3.14), and the proof is complete.
